

Warm up right, train safely

Body map + safe-sensation scale + 3-layer warm-up

A simple way to know where your body is stiff and how to actually warm up before training.

What you'll get

A quick body map, the safe-sensation scale, and the 3-layer warm-up.

No fluff

A simple method to warm up better and reduce injury risk — no magic promise.

Before you start

This guide is educational and is here to help you move better, not to replace professional guidance.

Read before using

This material does not replace medical, physical therapy, or exercise-professional assessment. Sharp pain, tingling, or pain that worsens with every workout are signs to stop and seek guidance.

- The goal isn't to become an 'elastic' person — it's to become more functional and aware of your own body.
- Stretching isn't a flexibility competition: light discomfort, never intense pain.
- If you have an injury, persistent pain, or a medical condition, adapt the plan with a qualified professional.

Quick body map

Before applying any routine, do an honest read of how your body moves today.

Area	Simple test	When to adapt
Ankle	Squat with heels on the ground	Pain in the tendon or a big loss of range
Hip	Controlled deep squat	Pain in the groin, lower back, or side of the hip
Shoulders	Raise arms above your head	Pain, tingling, or instability

• How to interpret it

The goal isn't to diagnose yourself. Use the tests to choose priorities — wherever you're stiffest is where it's worth starting.

Safe-sensation scale

Use this scale so you don't confuse productive discomfort with a warning sign.

Level	Sensation	Conduct
0-2	Light stretch, full control	Safe to maintain
3-4	Moderate discomfort, calm breathing	Use with caution, don't force it
5-6	High tension, body wants to escape	Reduce range or time
7-10	Pain, sharp pain, shock, or fear	Stop and adjust; if it persists, seek assessment

The 3-layer warm-up

The ideal preparation combines temperature, specific mobility, and practicing the main movement.

Layer	What to do
1. General	3-6 min of walking, biking, or light movement to raise temperature.
2. Specific	Mobility and activation matched to the workout: shoulder, hip, ankle, thoracic.
3. Preparatory	Light sets of the first exercise, with perfect technique.

• Why this works

The warm-up prepares the body and attention — it shouldn't tire you out. The complete routines by joint, the 30-day schedule, and injury prevention are in the complete guide.

Ready for the complete guide?

That was just the beginning. In the complete **Mobility, Stretching and Injury Prevention** guide you get: A/B routines by joint (shoulders, hips, ankles, spine, knees, and wrists), a stretching library, injury prevention by area, routines for real life, and a 30-day schedule.

To be transparent: no guide eliminates injury risk. The focus is reducing risk with method, not promising you'll "never have pain again."
